

Fragments from the Wild Struggle Against PRGT and its World

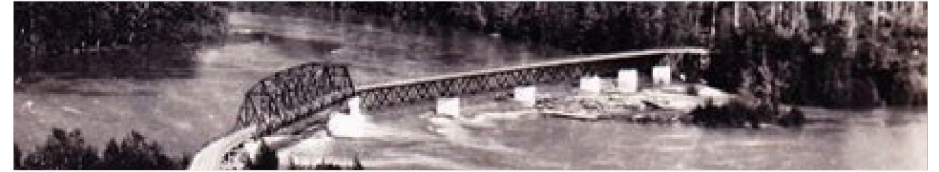

Over the course of this past year a proposal for struggle has been fiercely put forward in both words and action in northern British Columbia. This remote territory is ravaged by the violent extraction of raw materials demanded for the daily reproduction of society and its “progress”. With expanses of clear-cuts, open-pit gold and coal mines that reach the depths of hell, railroads with shipping containers full of useless objects and barrels of petrol, the third largest port in the country, and a constant flow of LNG from gas fields in the east to export facilities on the coast, this region is made to be a *sacrifice zone*. While no effort is spared for the security and expansion of these noxious industries’ passage *through* this territory, the land and life *in the way* has been designated, by flicks of the pens of the Canadian state, as expendable. In the documentation published by the latest insult in this extractive saga, the Prince Rupert Gas Transmission Pipeline (PRGT), this sacrificial designation is made explicit. Through calculations of population density and other scientific nonsense, the event of an accidental compression station explosion has been deemed an “acceptable” risk for the greater good of the project.

PRGT is set to be constructed across what will be a third energy corridor of its kind in BC, transporting liquified natural gas to an export facility on the coast. It will be the northernmost corridor in the province to date, carving an 800km long scar across mountains, forests, and countless bodies of water. It will crash through towns filled with people, valleys home to moose, elk, grizzlies, wolves, cougars, and lynx, and rivers running with salmon from the pacific. It will require the further extraction of natural gas via hydraulic fracturing which sets off literal earthquakes, flaming house-hold tap-water, spontaneous miscarriages, gaseous leaks, and the theft of the night sky from LNG flaring so large in scope that it can be felt rumbling in the bodies of those laying in their beds within dozens of kilometers in every direction.

But we already know this story, I want to tell a different one. Despite what the state and its media so badly wants us to believe, the north is not a scattering of sleepy towns dispersed among pristine wilderness, nor is it a sparse frontier with people standing in line begging for employment and state solutions to their problems. It is a territory filled with people who want to sustain their own lives and shut this grinding machine down, bringing it to a halt. Thousands of pages could be written about the horrors stewing and crawling out of the minds of the politicians, scientists, and corporates of this world, but I would prefer to read thousands of pages written about all those who embrace the revolt they feel in their hearts when they look at what has been planned for us and ferociously live out a dream that is totally other. These words are written for all those who want to flip this world on its head, who think and act accordingly.

This text is a synthesis of some of what can be garnered so far in the catching flames of a fight against the state and the sickening strangle-hold of its tendrils. What has been sown is still very young, and is a struggle belonging to all those who see themselves in it. One of self-organizing and autonomously fighting in a state of permanent conflictuality against all that seeks to destroy us.

Call to action against the PRGT pipeline

Source <https://bccounterinfo.org/2024/11/01/call-to-action-against-the-prgt-pipeline/>

As of August 2024, construction work has started on the the Prince Rupert Gas Transmission (PRGT) pipeline. The project is owned by Western LNG and the Nisga'a Nation, the latter which has allowed for construction to start on their land first, the rural Nass river valley that sits adjacent to the pacific ocean. State and industry are committed to developing an "energy corridor" through the remote region. The nearly completed and fiercely contested Coastal Gas Link pipeline was the first pipeline in the southern energy corridor, and PRGT is the first pipeline projected for the northern energy corridor. The line is set to end at Ksi Lisims LNG terminal (Nisga'a owned as well) where liquid and natural gas would be stored and prepared for export to international markets by tankers. LNG is being sold as a green alternative for those looking to shift away from coal. But the green transition is a lie. We know that energy, and its current reorganization, is inseparable from domination, capitalist exploitation and the extractivist logic that devastates the land. We propose attack.

Social tension is rising against PRGT. Multiple sites of resistance have been brewing across North-Central BC. In 2016, during the first attempts of construction, Madii Lii camp was set up to blockade the access to the pipeline right of way in the Suskwa valley, in Gitxsan territory. The camp remains to this day, and northwest of there, another Gitxsan blockade has been set up on the Cranberry Connector, the northern of the two roads into the Nass valley. Gitxsan people have a long history of defending their land, notably some anti-logging struggles in the 80-90's, and expressing their solidarity with their Wet'suwet'en neighbors by blockading railways. We stand in solidarity with native resistance which will likely snowball into more blockades in key areas of the project. Conjointly, as anarchists we have our own projects of destruction. Autonomous attacks allow us to expand the methods of struggle, to engage in conflict at our own pace how we see fit and where we sit fit, and to not compromise our visions and values. We propose an offensive struggle of diffuse blows carried out by affinity groups in dispersed formation, as other have said to act without forming compact columns, without building permanent indefensible encampments. Instead we seek to extend diffuse hostilities over a large terrain.

An autonomous struggle against the PRGT pipeline project begins by looking at the tool and capacities we currently have, identifying what we need to learn and acting from that without delay. The project spans thousands of kilometers, the offices, homes and interests of the companies behind it are spread throughout Canada and beyond. An expansive practice of attack can identify and target these diverse sites. Below are lists of companies involved in the project as well as links to a map of the project's right of way. More work should be done to identify additional companies involved and the findings should be shared via counter info sites.

Companies involved in PRGT project

- **Ledcor** - Is a construction company operating primarily in Canada and United States. Ledcor operates in a wide range of industries, including the construction of buildings and civil infrastructure, technical services such as communication networks, forestry, mining, property development and management, transportation, marine operations, and several energy projects, including oil, gas, and Liquefied Natural Gas. Ledcor is leading the current phase of infrastructure upgrades necessary to begin pipeline construction. Ledcor is currently upgrading or maintaining roads, bridges, man camp sites etc.
- **Bechtel** - Is an American engineering, procurement, construction, and project management company. Bechtel is managing the construction of the PRGT pipeline.
- **McElhanney** - provides surveying, engineering, GIS & remote sensing, community & transportation planning, landscape architecture, environmental services, and more. McElhanney has been and continues to be responsible for surveying, and monitoring of environment for the PRGT project. They have over 30+ locations across Western Canada. A McElhanney office near the PRGT project was target of an anonymous arson in late September see link (<https://bccounterinfo.org/2024/10/12/arson-attack-in-terrace-bc/>).

the option of disabling the power supply. This may include damaging the grounding, which is more time-consuming but notably harder to detect and locate.

Technical details and diagrams of track circuits, and specifically how to compromise them, are readily available in engineering textbooks at your local library, past communiqués, and even neatly presented in certain PDFs hosted on the Government of Canada's website.

Not much more needs to be said. However, recall that one of the discursive characteristics of the Canadian state is its spatiality, which is also, perhaps, its most exploitable vulnerability. Reflect on past moments in struggle and assertions of sovereignty and recall how strategically positioned rail blockades effectively stretched and divided state forces, offering land defenders at key rupture points critical time to reorient and regroup. That said, disrupting the logistics of extractivism is often most effective when undertaken unilaterally.

Look no further for evidence of the effectiveness of such actions against a wholly undefended infrastructure than in the words of one counterinsurgency state operative:

"If ever there was a military showdown between Indigenous people and the Canadian army, the first target would be the railway lines and burning cars would be on every railway line in Canada ... would almost be impossible to stop despite all the Canadian military and police alerted to the potential. A burning car on a railway track is not simply a blockade, it is also a very efficient and economical weapon. A car with a full fuel tank would burn at a temperature high enough to warp the track and require extensive repairs."

Until paths cross in the night, on the frontlines of the only good war: the war against PRGT, against Empire, and against all forces that seek to estrange and domesticate.

A Hot Week in Terrace

Terrace Fire Department has been busy responding to two separate arsons targeting Kalum Cabs within five days of each other. Kalum Cabs is a taxi and shuttle company based in Terrace which operates in a few neighboring towns offering private and commercial shuttle services. According to a press release, early on the morning of August 24th police arrived hot on the heels of firefighters attempting to extinguish two of the companies shuttle busses which were found in flames. The buses were reported to be severely damaged and photos published showed charred pavement from where they had been parked. Judging from the photos it seems the remains of the busses were oddly moved before the photo was taken. The wee hours of August 29th must have been another dreadful surprise for the forces of order who found themselves looking at another arson this time targeting Kalum's taxi cabs. Police reported several cabs were targeted and one was seriously damaged.

For readers unfamiliar with Terrace it's worth noting some visible tensions in the city around poverty, gentrification, resource extraction and the interplay of all three. The city is the rapidly growing industrial hub of the region, many of the surrounding projects depend on workers flown in from afar delivered via taxi and shuttle around town where they stay during the duration of their contracts. This industrial reality is inseparable from the gentrification, dispossession and poverty which defines the city.

West Coast Rail Sabotage

Why should a struggle against a pipeline stop at its immediate contractors? After all, is it conceivable that while this curse on land and life is being prepared, organized and put into motion at all economic and political levels, that the infrastructure that pumps the Canadian economy should be left alone?

Clearly, the anonymous authors of the following submission to BC Counter Info didn't think so.

Following the approval of the PRGT in June, dozens of track circuits throughout BC have been shorted, disconnected, or otherwise tampered with.

The vast majority of track circuits operate on direct current (DC) and are relatively easy to induce a fail state. The quickest and most discreet method has proven to be the simple snipping of the cable bonding track blocks, requiring little more than a good pair of cutters. Alternatively, a 4 AWG copper wire (commonly found connecting residential main service panels) can be securely fastened to the rail head. And, of course, there is always

Call to Action Against the PRGT Pipeline

As of August 2024, construction work has started on the the Prince Rupert Gas Transmission (PRGT) pipeline. The project is owned by Western LNG and the Nisga'a Nation, the latter which has allowed for construction to start on their land first, the rural Nass river valley that sits adjacent to the Pacific Ocean. LNG is being sold as a green alternative for those looking to shift away from coal. But the green transition is a lie. We know that energy, and its current reorganization, are inseparable from domination, capitalist exploitation and the extractivist logic that devastates the land. We propose attack.

Social tension is rising against PRGT. Multiple sites of resistance have been brewing across North-Central BC. In 2016, during the first attempts of construction, Madii Lii camp was set up to blockade the access to the pipeline right of way in the Suskwa valley, in Gitksan territory. The camp remains to this day, and northwest of there, another Gitksan blockade has been set up on the Cranberry Connector, the northern of the two roads into the Nass valley.

Gitksan people have a long history of defending their land, notably some anti-logging struggles in the 80-90's, and expressing their solidarity with their Wet'suwet'en neighbors by blockading railways. We stand in solidarity with native resistance which will likely snowball into more blockades in key areas of the project. Conjointly, as anarchists we have our own projects of destruction. Autonomous attacks allow us to expand the methods of struggle, to engage in conflict at our own pace how we see fit and where we see fit, and to not compromise our visions and values. We propose an offensive struggle of diffuse blows carried out by affinity groups in dispersed formation, as other have said to act without forming compact columns, without building permanent indefensible encampments. We seek to extend diffuse hostilities over a large terrain.

An autonomous struggle against the PRGT pipeline project begins by looking at the tool and capacities we currently have, identifying what we need to learn and acting from that without delay. The project spans thousands of kilometers, the offices, homes and interests of the companies behind it are spread throughout Canada and beyond. An expansive practice of attack can identify and target these diverse sites.

Against Extractivism: PRGT and its Actors

Extractivism facilitates the exploitation, control, and export of raw materials to fuel industrial development. It removes resources from the land, while dislocating any 'benefits' to a multi-national investor class. Extractivism is a social relation; it reflects a society that extracts and its introduction makes all of life a potential resource. It reduces an intricate web of relationships between human and non-human into commodities within a centralized system of production and circulation. In a deranged collaboration, the state and capital mutually reinforce their domination by enabling and facilitating extractivism through legalistic mechanisms. Accumulation through dispossession of land (and its relationships) has always been central to the state-making project of Canada.

Refusing extractivism means refusing to subordinate land and human activity to profit and the logics of capital. Extractivism is war; our only response is revolt.

We once again find ourselves situated within another pipeline struggle- this time against Prince Rupert Gas Transmission (PRGT). While a war is most definitely being waged, our role isn't to engage with the state militarily, but to disorganize its ability to function logistically: to impede the development of global resource markets; and to produce conditions that prevent the circulation of resource commodities. Our proposal moves away from the symbolic: the politics of recognition and any form of representation. As our mentors remind us, any demand addressed to an interlocutor is defeat. Let us instead narrow our focus on disrupting the logistics of extractivism. We think this means the spreading of social revolt: an uncontrollable refusal of extractivism as a way of life, and the spread of self-organized action against this project.

In the spirit of understanding the logic and logistics of extractivism, we've provided a 'map'. This map is not a set of directions, but a survey of the terrain we find ourselves entangled within. PRGT can itself be seen as a logistical project: to accelerate the flow and transportation of gas; and to increase access to new markets. The development of the pipeline and terminal each require their own logistics: to secure investors, purchasers, and contractors; to deforest right of ways; to build roads, bridges, man camps, compressor stations and terminals; to transport materials, machines, pipe, and men; to secure their project with surveillance, security, cops, and legislative tools. This map is just a beginning: for developing further research; for material intervention; for a world without PRGT and a world without extractivism.

No Rest for McElhanney

On August 10th at around 4am in Smithers BC, two trucks belonging to McElhanney (who provide "consulting services" to PRGT) were burned in Smithers, BC. As the journey time required to perform their dirty work rises to precipitous levels in this region, perhaps the added time for self-reflection will reveal a more definitive solution to the tendency of their equipment to auto-combust: to disappear entirely.

Maybe "Melding" With PRGT Wasn't Such a Good Idea...

4 Gitxsan Development Corporation Vehicles Burned in New Hazelton

On August 18th 2025, in the sleepy town of New Hazelton, four Gitxsan Development Corporation vehicles were burned.

Gitxsan Development Corporation, a "unique, melding of the traditional governance of the Gitxsan with the contemporary needs of business" works with McElhanney Geomatics Engineering which had vehicles destroyed by fire in [Smithers](#) and [Terrace](#).

Perhaps it was their commitment to "integrity", which led them to the facilitate the plunder of this territory in return for.. who knows what? Bribes, handshakes, connections?

Anyway, it should be clear now that this is not all that is coming to those who collaborate with the PRGT death project. The vultures who are intent on picking our corpses, and that of the land can wear many disguises. The wise stewardship of indigenous (looking) capitalism is only the latest. But in among the resigned, the fearful, and the nakedly corrupt, there are some who don't forget to furnish those responsible for the carve up with nothing less than they deserve. This awareness comes with consequences, of which such events are only a beginning.

Seasons Greetings for Red Rock Inspection Scale

Somebody didn't wait for Santa to bring them what they wanted for Christmas. Early in the morning on December 24th, a fire destroyed the commercial inspection scale in Red Rock. This scale is located 35km south of Prince George on Highway 97 with damage estimated at \$850,000.

This scale is one of 24 operated by CVSE (Commercial Vehicle Safety and Enforcement) throughout the province. Whether they are conducting the industries' pillage of the territory or supervising the roads on behalf of the state, their destruction by a fire like this warms everyone's heart this festive season.

RCMP Station Lit Up During “Business Hours”

The daily humiliations of life under state domination do not always go unanswered, sometimes people decide that enough is enough. On May 22nd someone's hunger for hog-roast couldn't be put off till night time. In broad daylight they set fire to the exterior wall of the RCMP detachment in Fort Nelson with officers still inside.

Imagine their surprise when the air intake/air conditioner pulled a “considerable amount of smoke inside” which resulted in an evacuation of the building, an escape by the hairs on their chinny chin chins!

In a region pilfered by logging, LNG fracking and the inseparable violence of poverty, alienation, and extractivism revolt is no surprise. We hope this one of many more threads to come in a tapestry of resistance against the control of the Canadian state.

Background:

Prince Rupert Gas Transmission (PRGT) is a pipeline project running from Hudson's Hope to an unbuilt floating terminal on Nisga'a coastline called Ksi Lisims. Gas is extracted from the Montney Formation, a shale gas formation requiring hydraulic fracturing (fracking). Industry must first inject a high pressure fluid into the shale formations to create thousands of little cracks to allow for the gas to flow. Gas is then extracted and shipped via pipeline. The gas intended to be shipped to Ksi Lisims will then be supercooled to -160°C to convert it to liquefied natural gas before being loaded onto LNG tankers to be shipped to Asia.

Currently known actors:

PRGT is owned by Western LNG and Nisga'a Nation.

Extractors in this project are represented collectively by **Rockies LNG**, a consortium of companies including: Advantage Energy Ltd.; Birchcliff Energy Ltd; Bonavista Energy Corporation; Crescent Point Energy Corp, NuVista Energy Ltd.; Ovintiv Inc.; Paramount Resources Ltd.; Peyto Exploration and Development Corp.; and Tourmaline Oil Corp.

Known Investors in the pipeline include: **Blackstone Inc**, **Jeffries Financial Group**, **Transition Equity Partners**, and **Stone Peak**.

Purchase agreements (companies buying the LNG) are currently established with **Shell** and **Total Energies**

Known Contractors include:

- **Bechtel**- Lead contractor; overseeing and managing execution of project
- **Stantec**- Environmental Consultant
- **Ledcor**- oversaw 2024 workplan and logistics (very likely involved in future work)
- **PCS** (Project Consulting Services)- owners engineer to support with project management and oversight of various engineering, surveying and other contractor entities
- **Roy Northern Land Services/ AIM** land services- permitting support (environmental, archaeological consultants)
- **McElhanney**- GIS field data, assist w road design- provided software to “client”
- We are still unaware of many potential contractors including Man Camp operations, compressor station operations, electrical substation operations, welders, pipefitters, truck rental agencies, equipment rental agencies, etc. These will become apparent in time. For example, **Aecon** and **Tacten** Industrial were both contracted for the CGL pipeline- we anticipate they will also be involved in this project.

Known Equipment Providers (Front End Engineering) include:

- **Samsung Heavy Industries**- Liquefaction technology

- **Black & Veatch**- Liquefaction technology
- **Siemens Energy**- Electrical compression system (same as Woodfibre LNG)

Construction Sequence

The typical pipeline sequence along the right-of-way (where the pipeline will be placed) is as follows:

1. Survey and Staking
2. Clearing
3. Front-end Grading
4. Topsoil Stripping
5. Restaking of Centre-line Trench
6. Stringing Pipe
7. Field Bending Pipe
8. Welding Pipe
9. X-ray Inspection and Weld Repairs
10. Trenching
11. Lowering Pipe
12. Backfill, Testing & Restoration

Prior to site preparation, we can anticipate road and bridge upgrades and new roads built to connect existing roads to the ROW. Site Preparation (steps 2-5) are anticipated to take a year with pipeline installation expected to take 4-6 months. Each aspect in the development of this project requires specific machines, specific contractors, and specific labourers. This information can be found in many ways including: assessment reports (BCER, BCEAO), press releases and most importantly, by being on the land and in the community.

Our actions will speak for themselves but let us be clear just this once: Prince Rupert Gas Transmission Line will never be built.

Chronology of Attack Sept '24 – Sept '25

Bad Night for McElhanney

Quadruple Vehicle Fire Spreads to Building

On the morning September 26th four vehicles were severely damaged as well as buildings nearby in an arson attack in Terrace BC. Despite the understandable shyness of the RCMP and the media to publish photos and exact details, a few things remain clear. Judging by the address released by the media [the 5000 Block of Pohle on the Southside], it appears that the company targeted was none other than McElhanney. This infamous firm, afflicted by many unfortunate occurrences recently, have a large portfolio providing surveying, engineering, GIS & remote sensing, landscape architecture, environmental services across western Canada. Near Terrace, McElhanney is working on the controversial PRGT pipeline, which has seen resistance via occupations and blockades. Further south the company has used GIS data to help plan work for the controversial TMX pipeline. In north eastern BC McElhanney has worked on providing data, and plans for the expansion of LNG well sites and pipelines.

Their consulting work for PRGT may well be paid handsomely but this doesn't save them from those who settle their accounts in an incendiary way. Perhaps they will discuss factoring in this hot atmosphere into their "environmental assessments" on the very long walks between assignments they now face.

Tree Spiking Targeting PRGT Pipeline

There are as many ways to fuck with the pipeline as there are people with beating hearts (and at least a few brain cells). Sometime in November the following communication was uploaded to BC Counter Info:

We spiked thousands of trees along the PRGT pipeline right of way between Fort Saint James and New Aiyansh. We pre-drilled holes in trees and then pounded 6" spikes into the trees. Its up to each of us to combat this project, we hope this effort poses one more obstacle.
